

Attack Lab

Sungyong Ahn

Agenda

- Stack review
- Attack lab overview

x86-64: Register Conventions

- Arguments passed in registers:
`%rdi, %rsi, %rdx, %rcx, %r8, %r9`
- Return value: `%rax`
- Callee-saved: `%rbx, %r12, %r13, %r14, %rbp, %rsp`
- Caller-saved: `%rdi, %rsi, %rdx, %rcx, %r8, %r9, %rax, %r10, %r11`
- Stack pointer: `%rsp`
- Instruction pointer: `%rip`

x86-64: The Stack

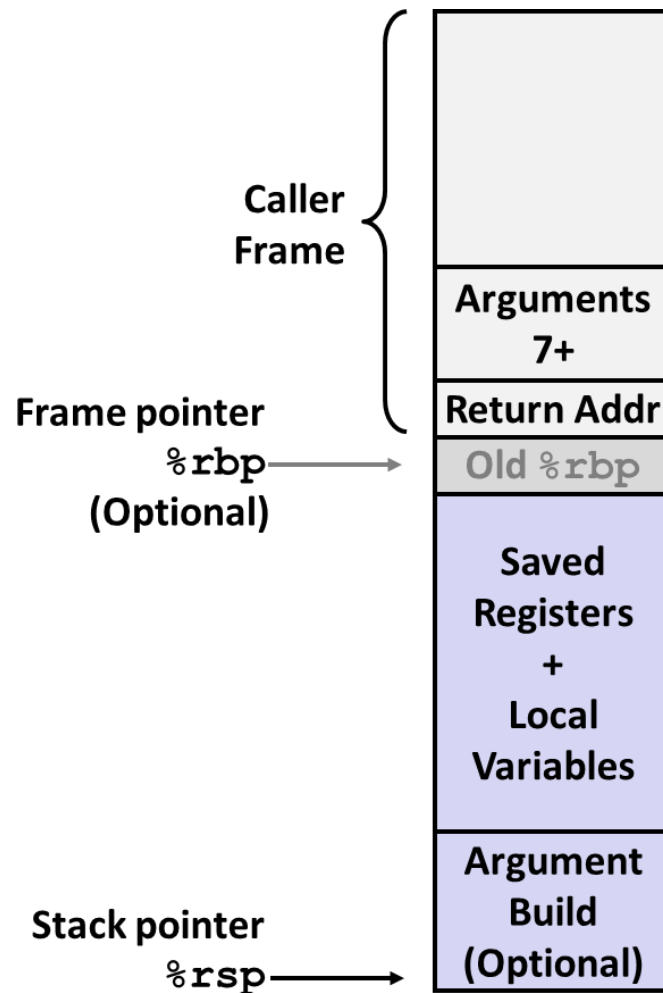

- Grows **downward** towards **lower** memory addresses
- `%rsp` points to **top** of stack

- `push %reg`: subtract 8 from `%rsp`, put `val` in `%reg` at `(%rsp)`
- `pop %reg`: put `val` at `(%rsp)` in `%reg`, add 8 to `%rsp`

x86-64: Stack Frames

- Every function call has its own **stack frame**.
- Think of a frame as a workspace for each call.
 - Local variables
 - Callee & Caller-saved registers
 - Optional arguments for a function call

x86-64: Function Call Setup

Caller:

- Allocates stack frame large enough for saved registers, optional arguments
- Save any caller-saved registers in frame
- Save any optional arguments (in **reverse order**) in frame
- `call foo`: push `%rip` to stack, jump to label `foo`

Callee:

- Push any callee-saved registers, decrease `%rsp` to make room for new frame

x86-64: Function Call Return

Callee:

- Increase `%rsp`, pop any callee-saved registers (in **reverse order**), execute `ret: pop %rip`

Attack Lab Overview

- What is Attack Lab?
 - **Five** buffer overflow attacks on **two** programs having different security vulnerabilities
 - You will learn different ways that attackers can exploit security vulnerabilities
 - For a better understanding of how to write programs that are more secure
 - To understand the stack and parameter-passing mechanisms
 - For a deeper understanding of how x86-64 instructions are encoded
 - More experience with GDB and OBJDUMP

Attack Lab Overview: Phases 1-3

Overview

- Exploit x86-64 by overwriting the stack
- Overflow a buffer, overwrite return address
- Execute injected code

Key Advice

- Brush up on your x86-64 conventions!
- **Use objdump -d** to get this disassembled version
- Be careful about byte ordering

Attack Lab Overview: Phases 4-5

Overview

- Utilize return-oriented programming to execute arbitrary code
 - Useful when stack is non-executable or randomized
- Find gadgets, string together to form injected code

Key Advice

- Use mixture of pop & mov instructions + constants to perform specific task

ROP Example

- Draw a stack diagram and ROP exploit to **pop a value 0xBBBBBBBB into %rbx** and **move it into %rax**

Gadgets:

address₁: mov %rbx, %rax; ret

address₂: pop %rbx; ret

```
void foo(char *input){  
    char buf[32];  
    ...  
    strcpy (buf, input);  
    return;  
}
```

ROP Example: Solution

Gadgets:

Address 1: `mov %rbx, %rax; ret`

Address 2: `pop %rbx; ret`

```
void foo(char *input){  
    char buf[32];  
    ...  
    strcpy (buf, input);  
    return;  
}
```

Get your target file

- You can obtain your target from <http://164.125.68.221:15213>
 - target k .tar (k is the unique number)

CS:APP Attack Lab Target Request

Fill in the form and then click the Submit button once to download your unique target.

It takes a few seconds to build your target, so please be patient.

Hit the Reset button to get a clean form.

Legal characters are spaces, letters, numbers, underscores ('_'),
hyphens ('-'), at signs ('@'), and dots ('.').

User name
Enter your Student ID

Submit

Reset

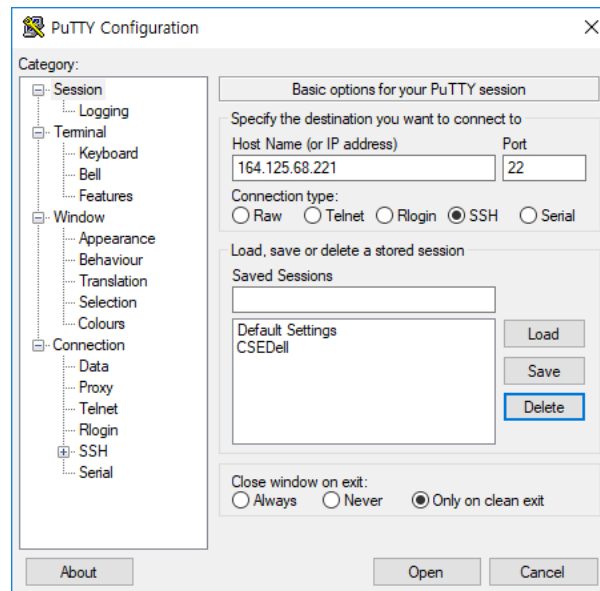

Get your target file

- Move your target **k**.tar file to **CSEDe11** (**164.125.68.221**)
- Use WinSCP
 - <https://winscp.net/eng/download.php>

Get your target file

- Extract your `targetk.tar` file on **CSEDe11** (**164.125.68.221**)
 - Use putty for SSH connection
 - <https://www.chiark.greenend.org.uk/~sgtatham/putty/latest.html>
 - `tar -xvf targetk.tar`

Get your target file

- The files in `targetk` include
 - `README.txt`: A file describing the contents of the directory
 - `ctarget`: An executable program vulnerable to code-injection attacks
 - `rtarget`: An executable program vulnerable to return-oriented-programming attacks
 - `cookie.txt`: An 8-digit hex code that you will use as a unique identifier in your attacks.
 - `farm.c`: The source code of your target's "gadget farm," which you will use in generating return-oriented programming attacks.
 - `hex2raw`: A utility to generate attack strings.
- **IMPORTANT NOTE:** You can work on your solution only on the **CSEDe11** machine.

Target Programs

- Both CTARGET and RTARGET read strings from standard input with the function `getbuf`
 - It has buffer overflow vulnerability

```
1 unsigned getbuf()  
2 {  
3     char buf[BUFFER_SIZE];  
4     Gets(buf);  
5     return 1;  
6 }
```

Target Programs

- If the string typed by the user and read by `getbuf` is sufficiently short

```
unix> ./ctarget
Cookie: 0x1a7dd803
Type string: Keep it short!
No exploit.  Getbuf returned 0x1
Normal return
```

Target Programs

- Typically an error occurs if you type a long string

```
unix> ./ctarget
Cookie: 0x1a7dd803
Type string: This is not a very interesting string,
Ouch!: You caused a segmentation fault!
Better luck next time
```

Target Programs

- Command line arguments
 - `-h`: Print list of possible command line arguments
 - `-q`: Don't send results to the grading server
 - `-i FILE`: Supply input from a file, rather than from standard input

Attack Lab Overview

- HEX2RAW

- Your exploit strings will typically contain byte values that do not correspond to the ASCII values for printing characters.
- The program `HEX2RAW` can help you generate these raw strings.

```
# echo "30 31 32 33 34 35" | ./hex2raw  
012345
```

```
# cat exploit.txt | ./hex2raw | ./ctarget
```

- `HEX2RAW` also supports C-style block comments

```
bf 66 7b 32 78 /* mov $0x78327b66,%edi */
```

Attack Lab Overview

- Important points
 - Your exploit string must not contain byte value 0x0A ('\n') at any intermediate position
 - HEX2RAW expects two-digit hex values separated by a whitespace

```
../hex2raw < ctargget.l2.txt | ../ctargget
Cookie: 0x1a7dd803
Type string:Touch2!: You called touch2(0x1a7dd803)
Valid solution for level 2 with target ctargget
PASSED: Sent exploit string to server to be validated.
NICE JOB!
```

Attack Lab Overview

- Auto grading server
 - When you have correctly solved one of the levels, your target program will automatically send a notification to the grading server.
 - Unlike the Bomb Lab, there is no penalty for making mistakes in this lab.
 - You can view the scoreboard by pointing your Web browser at <http://164.125.68.221:15213/scoreboard>

Phase1: Code Injection Attacks: CTARGET

■ Level 1

```
1 void test()  
2 {  
3     int val;  
4     val = getbuf();  
5     printf("No exploit.  Getbuf returned 0x%x\n",  
6 }
```

```
1 void touch1()  
2 {  
3     vlevel = 1;          /* Part of validation protocol */  
4     printf("Touch1!: You called touch1()\n");  
5     validate(1);  
6     exit(0);  
7 }
```

Your task is to get CTARGET to execute the code for `touch1` when `getbuf` executes its `return` statement, rather than returning to `test`.

Phase2: Code Injection Attacks: CTARGET

■ Level 2

```
1 void touch2(unsigned val)
2 {
3     vlevel = 2;          /* Part of validation protocol */
4     if (val == cookie) {
5         printf("Touch2!: You called touch2(0x%.8x)\n", val);
6         validate(2);
7     } else {
8         printf("Misfire: You called touch2(0x%.8x)\n", val);
9         fail(2);
10    }
11    exit(0);
12 }
```

Your task is to get CTARGET to execute the code for `touch2` rather than returning to `test`. In this case, however, **you must make it appear to `touch2` as if you have passed your cookie as its argument.**

Phase3: Code Injection Attacks: CTARGET

■ Level 3

```
1 /* Compare string to hex representation of unsigned value */
2 int hexmatch(unsigned val, char *sval)
3 {
4     char cbuf[110];
5     /* Make position of check string unpredictable */
6     char *s = cbuf + random() % 100;
7     sprintf(s, "%.8x", val);
8     return strncmp(sval, s, 9) == 0;
9 }
10
11 void touch3(char *sval)
12 {
13     vlevel = 3;          /* Part of validation protocol */
14     if (hexmatch(cookie, sval)) {
15         printf("Touch3!: You called touch3(\"%s\")\n", sval);
16         validate(3);
17     } else {
18         printf("Misfire: You called touch3(\"%s\")\n", sval);
19         fail(3);
20     }
21     exit(0);
22 }
```

Your task is to get CTARGET to execute the code for `touch3` rather than returning to test. **You must make it appear to `touch3` as if you have passed a string representation of your cookie as its argument.**

Return-Oriented Programming(ROP)

- It uses **randomization** so that the stack positions differ from one run to another. This makes it impossible to determine where your injected code will be located.
- It marks the section of memory holding the stack as **nonexecutable**, so even if you could set the program counter to the start of your injected code, the program would fail with a segmentation fault.

Return-Oriented Programming(ROP)

- For example, `rtarget` contains the following C function.

```
void setval_210(unsigned *p)
{
    *p = 3347663060U;
}
```

```
0000000000400f15 <setval_210>:
400f15:    c7 07 d4 48 89 c7    movl    $0xc78948d4, (%rdi)
400f1b:    c3                  retq
```

48 89 c7

movq %rax, %rdi

starts at address 0x400f18

movq *S*, *D*

Source <i>S</i>	Destination <i>D</i>							
	%rax	%rcx	%rdx	%rbx	%rsp	%rbp	%rsi	%rdi
%rax	48 89 c0	48 89 c1	48 89 c2	48 89 c3	48 89 c4	48 89 c5	48 89 c6	48 89 c7
%rcx	48 89 c8	48 89 c9	48 89 ca	48 89 cb	48 89 cc	48 89 cd	48 89 ce	48 89 cf
%rdx	48 89 d0	48 89 d1	48 89 d2	48 89 d3	48 89 d4	48 89 d5	48 89 d6	48 89 d7
%rbx	48 89 d8	48 89 d9	48 89 da	48 89 db	48 89 dc	48 89 dd	48 89 de	48 89 df
%rsp	48 89 e0	48 89 e1	48 89 e2	48 89 e3	48 89 e4	48 89 e5	48 89 e6	48 89 e7
%rbp	48 89 e8	48 89 e9	48 89 ea	48 89 eb	48 89 ec	48 89 ed	48 89 ee	48 89 ef
%rsi	48 89 f0	48 89 f1	48 89 f2	48 89 f3	48 89 f4	48 89 f5	48 89 f6	48 89 f7
%rdi	48 89 f8	48 89 f9	48 89 fa	48 89 fb	48 89 fc	48 89 fd	48 89 fe	48 89 ff

Return-Oriented Programming(ROP)

- Your code for `RTARGET` contains a number of functions similar to the `setval_210` function
 - We refer to as the *gadget farm*
- Your job will be to identify useful gadgets in the *gadget farm* and use these to perform attacks similar to those you did in Phases 2 and 3

Phase4: ROP Level2 : RTARGET

- You will repeat the attack of Phase 2, but do so on program `RTARGET` using gadgets from your *gadget farm*.
- You can construct your solution using gadgets consisting of the following instruction types, and using only the first eight x86-64 registers (`%rax-%rdi`).

Phase4: ROP Level2 : RTARGET

- You can find byte encodings of more instructions on the ***writeup***
 - *movq, popq, movl*
 - *ret* : This instruction is encoded by the single byte 0xc3.
 - *nop* : This instruction (pronounced “no op,” which is short for “no operation”) is encoded by the single byte 0x90. Its only effect is to cause the program counter to be incremented by 1.

Phase5 : ROP Level 3: RTARGET

- Phase 5 requires you to do an ROP attack on RTARGET to invoke function `touch3` with a pointer to a string representation of your cookie.

Generating Byte Codes

- Use `gcc` and `objdump` to generate byte codes for assembly instruction sequences

example.s

```
# Example of hand-generated assembly code
push $0xabcdef      # Push value onto stack
add $17,%eax        # Add 17 to %eax
movl %eax,%edx      # Copy lower 32 bits to %edx
```

```
ubuntu# gcc -c example.S
ubuntu# objdump -d example.o > example.d
```

example.d

```
example.o: file format elf64-x86-64
Disassembly of section .text:
0000000000000000 <.text>:
0: 68 ef cd ab 00 pushq    $0xabcdef
5: 48 83 c0 11 add     $0x11,%rax
9: 89 c2 mov     %eax,%edx
```

This string can then be passed through
HEX2RAW to generate an input string for
the target programs

68 ef cd ab 00 48 83 c0 11 89 c2

OR

```
68 ef cd ab 00 /* push $0xabcdef */
83 c0 11      /* add $0x11,%eax */
89 c2        /* mov %eax,%edx */
```

Summary

- Download your target and attack it!
 - <http://164.125.68.221:15213>
- 제출기한 : 5월 30일 11:59 PM
 - 하루 딜레이당 25% 감점
- 반드시 실습 서버(164.125.68.221)에서 수행할 것!!
(그 외의 환경에서는 실행 불가)

Summary

■ 제출물

■ **targetID_학번.pdf**: 각 phase에서 자신이 attack을 수행한 과정을 간략히 설명

- . PDF 파일로 제출
- . 표지 없이 간단히 첫 장 상단에 이름과 학번만 명시
- . 5장을 넘지 말 것, 초과시 보고서 점수 감점 사유.
- . PLATO로 제출

■ **targetID_sol.tar**: 각 phase별 solution file들을 tar로 압축한 파일

- . 각 solution file 이름: targetID.p1, targetID.p2, targetID.p3, targetID.p4, targetID.p5
 - 아래와 같이 실행 가능 해야함
 - > cat target.p1 | ./hex2raw | ./ctarget
- . > tar -cvf **targetID_sol.tar** targetID.p1, targetID.p2, targetID.p3, targetID.p4, targetID.p5
